Remote Maintenance for DRÄXLMAIER

Helmholz myRex24 is considered the uniform standard for the use of remote maintenance solutions within the DRÄXLMAIER Group. The operation of the "Helmholz myRex24" portal is the **responsibility of the DRÄXLMAIER Group**. Access data is therefore also provided to the supplier by the DRÄXLMAIER Group.
General information about the myRex24-Portal can be found unter following link:
Helmholz website
General help on the portal and its functions can be found at the following link:
Onlinehelp

Communication with the supplier regarding remote maintenance is carried out via the respective person responsible from the "Machine Line Planning (MLP)" area.
The supplier must ensure that the **IP-range of the private machine network** are made available to the DRÄXLMAIER Group. It is also necessary that the supplier informs about the **user accounts** to be created. Each account may only be assigned to one person, also can't be used a common (shared) email account.
To ensure a smooth start-up of the remote access, it is important that all information is addressed at an early stage.
Unless otherwise agreed, the supplier is responsible for ensuring that the VPN-router is properly **installed in the machine** and, if necessary, all interconnections between the VPN-router and other components (like f.e. PLCs) are made available (see. Fig. 1)

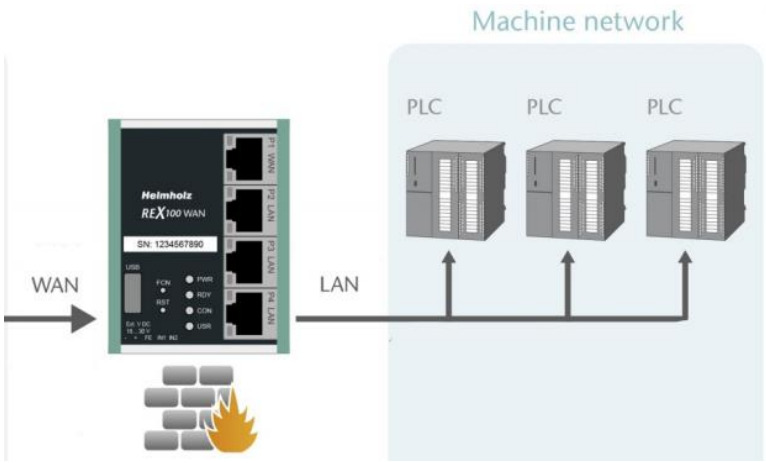

Fig. 1: Interconnections between VPN-router and other components.

The configuration of the VPN router and thus also the connection to the VPN portal "myRex24" operated by DRÄXLMAIER is the responsibility of the respective site IT of the DRÄXLMAIER Group. It may therefore be necessary for those responsible for the site IT to have physical access to the VPN router. In order to establish a VPN connection, it is necessary that the port TCP 1194 is released in the network of the supplier.
It is also necessary to use the VPN client shDAILUP / drxDAILUP.
This can be downloaded from the following address: Remote Maintenance: shDAILUP / drxDAILUP

The DRÄXLMAIER Group can provide support if problems occur when establishing a VPN connection. However, no assistance can be offered for the use of further third party software (e.g. Siemens TIA Portal / SIMATIC S7).

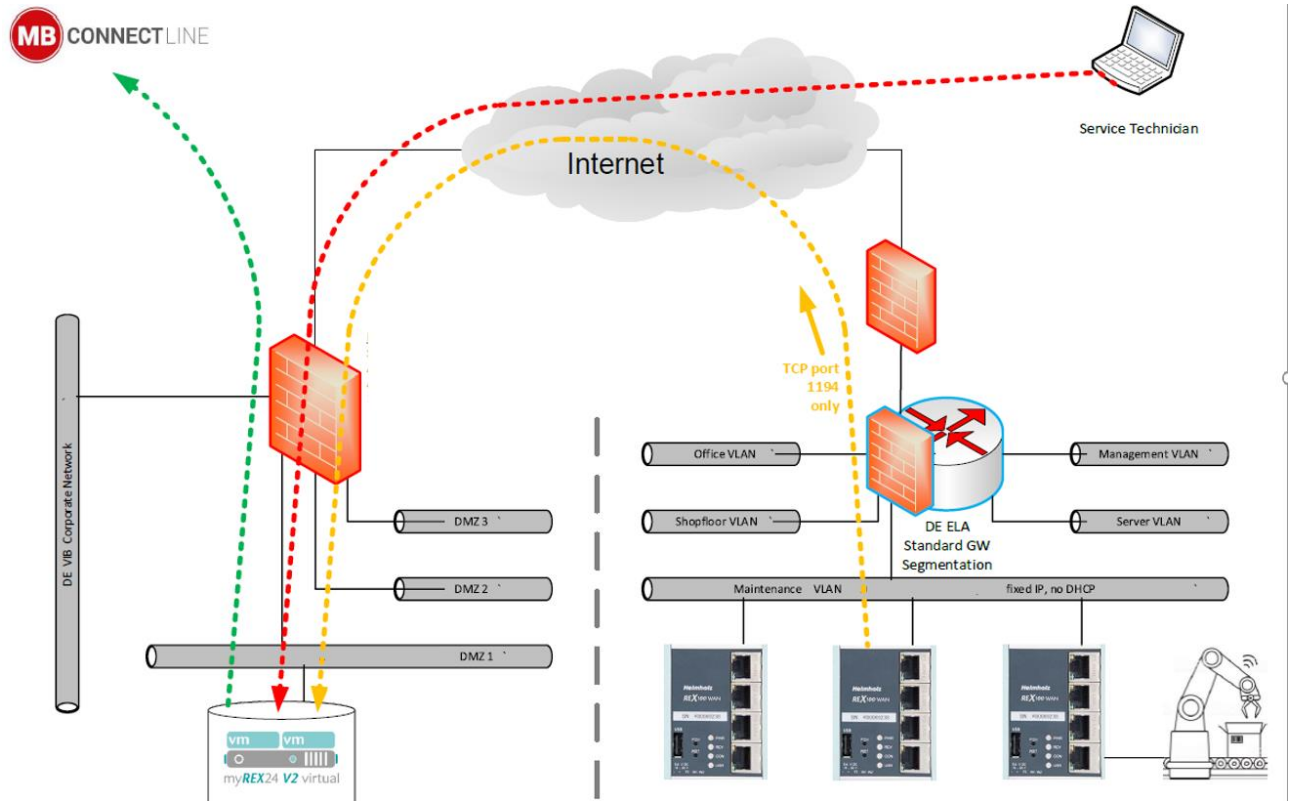

Since the use of the myRex24 portal operated by DRÄXLMAIER is mandatory, **only routers compatible** with the portal shall be used. In general, the used router must have a WAN-interface and analog, ISDN, GSM, GPRS, EDGE, UMTS or LTE are **not allowed**.
The company-wide standard used and also recommended router by the DRÄXLMAIER Group is the following:

- Helmholz REX100 WAN: See product specification

In addition, the following routers are compatible with the portal.

- Helmholz REX200 WAN: See product specification
- Helmholz REX250 WAN: See product specification
